

OPERATIONAL PERFORMANCE REPORT

BLUELINE LOGISTICS

Revenue · Fleet · Fuel · Maintenance · Safety

Analysis Period: 2022 – 2025

Prepared by: Blessing Chiamaka | June 2026

SQL | Power BI | DAX

EXECUTIVE SUMMARY

Three analytical domains · SQL & Power BI · Actionable business intelligence

Revenue & Customer

Identified top customers, profitable routes, and load/booking mix contributing to revenue concentration.

Fleet & Fuel Ops

Evaluated fuel spend (~\$922K), maintenance costs, truck downtime, and high-cost fleet assets.

Safety & Risk Mgmt

Examined incident patterns, at-fault & preventable rates, and claims cost distribution by driver.

Data Quality Approach: Due to inconsistent reporting periods and unmatched identifiers across tables, analyses were grouped into separate domains to preserve accuracy and avoid misleading cross-table comparisons.

KEY FINDINGS

Critical discoveries from Revenue, Fleet & Safety analysis

\$922.46K

Total Fuel Spend

Largest operational cost

62%

At-Fault Incidents

Driver accountability gap

63%

Preventable Incidents

Avoidable with intervention

Revenue is concentrated among a small customer group — top customers drive disproportionate share of total income, creating concentration risk.

Certain transport corridors are significantly more profitable; revenue is not evenly distributed across the route network.

A few trucks account for outsized maintenance costs and downtime — suggesting underperforming fleet assets needing targeted attention.

A small subset of drivers generates significantly higher claims costs, pointing to concentrated safety risk within the driver population.

Revenue & Customer Performance

Refrigerated Loads outperform Dry Van in revenue generation

What the Data Reveals

Revenue is concentrated among a small number of customers — the top 10 accounts contribute a disproportionately large share of total income.

This creates customer concentration risk: if a key account exits, profitability is materially impacted.

Route analysis reveals that specific transportation corridors consistently outperform others — revenue is unevenly distributed across the network.

Refrigerated load types generate slightly higher revenue than Dry Van, suggesting temperature-controlled freight holds a premium positioning.

Booking type variation also influences revenue — some booking categories align more strongly with high-value loads.

INSIGHT 02 · Fleet, Fuel & Operational Cost Performance

\$922.46K

Total Fuel Spend

Top 3

Trucks: High Maint. Cost

↑ Downtime

Linked to Same Trucks

Fuel Costs: Primary Cost Driver

At ~\$922.46K, fuel expenditure dwarfs all other operational costs. Spending is concentrated in a limited number of states, pointing to route patterns and regional price differences as contributing factors. Fuel efficiency monitoring by truck is largely absent.

Maintenance: Concentrated Problem

A small number of trucks account for a disproportionate share of repair costs and operational downtime. These chronic underperformers are likely aging assets or vehicles with recurring mechanical issues. Reactive maintenance is the dominant current approach.

INSIGHT 03 · Safety & Risk Analysis

Driver-level concentration of claims costs and high preventable incident rates represent the most immediately addressable risk factors.

62%

At-Fault Incidents

Majority of incidents directly attributable to driver actions

63%

Preventable Incidents

Over 6 in 10 incidents avoidable with proper intervention

Driver Risk Concentration

- A small number of drivers contribute a disproportionately high share of total claims costs.
- Risk exposure is not evenly distributed — targeted drivers require structured intervention, not blanket policy changes.
- Combining at-fault and preventable rates signals systemic training and supervision gaps.
- Early intervention through coaching and monitoring can significantly reduce claims exposure without losing experienced driver capacity.

RECOMMENDATIONS

01

Diversify Customer Portfolio

3–6 mo

Expand sales into new segments; introduce contract retention incentives. Target revenue stability within 12 months.

02

Focus on High-Value Routes & Loads

2–4 mo

Increase capacity on profitable corridors; prioritize refrigerated freight; optimize low-performing routes.

03

Implement Fuel Reduction Programme

1–3 mo

Establish preferred fuelling stations, monitor per-truck fuel efficiency, reduce mileage via route optimization.

04

Shift to Preventive Maintenance

3–12 mo

Mileage-based scheduling, recurring repair tracking, and evaluate replacement of chronically underperforming assets.

05

Structured Driver Safety Intervention

6–12 mo

4-phase process: Review → Training → Monitoring → Escalation. Target reduction in claims costs and incident frequency.

06

Preventable Incident Prevention

3–12 mo

Root-cause analysis, monthly safety reviews, driver safety scorecards, and safety-based reward programs.

CONCLUSION

From Data to Decisions

- A small number of customers, trucks, routes, and drivers account for a disproportionately large share of both revenue and cost.
- Targeted interventions on these critical contributors will deliver the greatest business impact.
- Operational cost control — not just revenue growth — is a direct pathway to improved profitability.
- Data-driven safety management can reduce claims costs, vehicle downtime, and insurance exposure simultaneously.

Key Takeaways

Revenue diversification

Fuel cost reduction

Proactive maintenance

Driver safety coaching

Route optimization
